Gravity Interceptor Requirements

*Gravity interceptors typically feature a flow-controlled interior.*

Images not shown to scale for the purpose of emphasizing specific features of the design.

- Vent shall terminate 10 feet above finished grade or through the roof.
- Vent diameter shall be 1/2 the diameter of the drain served and shall roll up above the center line of the horizontal drain.

All pipe and fittings shall be schedule 40 DWV from the building up to the sampling manhole.

SDR 35 or 3034 pipe is not approved for installation for the inlet piping from the building up to the interceptor and the outlet piping from the interceptor up to the sampling manhole.
