Newly planted trees need to be watered 1-2 times per week in spring and fall and 2-3 times per week in summer. Unlike watering a lawn, the goal of tree watering is to have saturation deep in the soil. Tree roots are usually 18-24” deep.

The exact amount of water is variable but generally 5-10 gallons per inch of trunk diameter is recommended. For newly planted trees, this means about 10-20 gallons per watering. Water should be applied evenly at a low flow rate until the soil is thoroughly soaked.

Mulch should be 2-4” thick and extend 3-5’ around the tree. It should be in an even flat layer, not piled up around the tree and no mulch should be touching the trunk. Refer to the diagram for proper mulching technique.

The provided watering bag is supplemental only and is not adequate as the sole source of water for newly planted trees. In addition to filling the bag, water with a hose, bucket, or dedicated irrigation system.
